

## **UnitedHealthcare Mammography/Cervical Screening Guidelines Remain Unchanged**

The United States Preventive Services Task Force (USPSTF) recently released new guidelines for mammography screening based on a review of the medical literature. As a result, the USPSTF is recommending that regular screening for breast cancer in women begin at age 50. The previously recommended age to begin routine screening was age 40.

**Our coverage for mammography and cervical cancer screening is unchanged.**

### **Mammograms**

We consider mammography an important screening procedure, one that has resulted in the ability to detect and treat breast cancer at earlier stages of the disease and save lives:

- UnitedHealthcare will continue to offer coverage of mammograms for women covered by a UnitedHealthcare insured plan when recommended by their physicians.
- Customers with a self-funded plan may modify coverage based on the recently reissued guidance but must provide us with specific instructions prior to the implementation of any coverage changes. However, we strongly recommend customers follow our policy and continue with the coverage for mammography unchanged.

### **Cervical Cancer Screening**

In addition, the American College of Obstetricians and Gynecologists (ACOG) recently changed its recommendations for cervical cancer screening, advocating less frequent screening for women in their 20s. **However, UnitedHealthcare is not changing its coverage policy on cervical cancer screening.** As is true for mammography, we recommend that women discuss with their physicians how frequently they should undergo cervical cancer screening.
